Zhiyou LIU

Education

2009.9-2013.7 Bachelor of Computer Science and Technology, Peking University, China

2013.9-2016.7 Master of Computer Software and Theory, Peking University, China

Internships

Redhat kernel QA Intern — During RHEL6.3's releasing process, I ran test suites of kdump and perf, and wrote regression test cases for virtual memory management subsystem.

Hulu Software Developer Intern — Wrote a highly configurable, reliable and high performance NodeJS library for user token validation and revoking. Now it is launched on Mozart, one of Hulu's most busy backends.

Projects

VURD[1] — A LLVM IR based static race detector, was completely implemented by me. Using inter-procedure analysis, like point-to analysis, lock state analysis and some other data-flow analysis, it detects potential unprotected accessing of memory locations shared between threads.

porting ftrace[3] to Unicore32[2] — ftrace is a kernel profiling feature. I ported the HAVE_DYNAMIC_FTRACE feature to Unicore32's kernel tree, by referencing the implementation on x86, and understanding stack frame and calling convention of Unicore32's ABI.

dpv[5][6] — Parttime project. It added keyword and stack tracing in a JavaScript interpreter to visualize dynamic programming solution.

dodidota(closed)[4] — Parttime project. A website that automatically gathers videos and tournament information and links videos with matches. Built using ExpressJS and MongoDB.

minic — Course project. A MiniC to Unicore32 toy compiler. I implemented the IR to assembly translation, including some data-flow analysis, optimization on IR and registers allocation. The compiler is significantly faster than gcc's -O0 on quick sort.

JOS — Course project. Implemented a single thread x86 operating system, with bootstrap from MBR, virtual memory management and process schedule.

Skills

Basic Knowledge — Solid background knowledge and practical experiences on OS, compiler, computer architecture, complexity theory, and web development.

Programming — Practical skills on software development in C and NodeJS. I wrote lots of course projects with C and won a few first prizes in TopCoder's Assembly contests with NodeJS. Also familiar with Python, Shell and Linux Userland.

Data Structure and Algorithm — Won a first-class prize of National Olympiad in Informatics in Provinces, an algorithm contest, during high school. Good at dynamic programming and searching technology.

CUDA — Won a third-class prize in Nvidia's college CUDA programming contest, solving single source shortest path in real road graph with some low-level optimizations.
